

The LZR UltraBright

The LZR UltraBright utilizes red light, near infrared light, and heat to encompass a broader range of wavelengths. Light therapy is thought to aid in the health and wellness of skin, muscles, and other parts of the body. The LZR UltraBright uses light emitting diodes (LEDs) to be used on the outer layer of the skin and can reach several centimeters into the body. Light Therapy has become popular with medical experts to help with weight loss, wrinkles, acne, hair loss, and many other issues.

The LZR UltraBright can help with:

- Weight loss
- Wrinkles
- Acne
- Hair Loss
- Wounds
- Migraines
- Seasonal affective disorder
- Carpal tunnel syndrome
- Muscle Mass
- Bone Growth
- Nerve Growth
- And more!

How does the LZR UltraBright differ from lasers?

Both modalities aim to stimulate the skin to provide more energy to the cells. Lasers, often used in surgery, emit a direct line of photons to target specific areas of the body. The LZR UltraBright uses LEDs to emit a broader range of wavelengths and cover larger areas. Due to reaching a wider area of the body, it is thought to be less harmful to the eyes and soothing to sensitive parts of the body.
